

Procedures for Errors

Submissions Failing to Upload:

1. Check if the correct file type is being submitted. If incorrect file type, notify user to submit correct file type
2. Check if submission is being added to the database. If submission is not found within the database, error is found between the upload method and the database.
3. If submission is found within the database, but not displayed on the site, the issue lies between the database and the front end bridge.
4. Browse the correct area of the codebase for potential logical Issues, if an issue is found correct it immediately
5. Once this is done, test both the old submission as well as a new one to see if it's an isolated issue.
6. If all else fails reset the database connection to the front end in case it is a timeout issue
7. If all these fail there is a critical issue in the codebase, server should be brought down for maintenance and the issue needs to be corrected

Comparisons Failing to Generate:

1. Check railway logs to see if there is an error, fix error if present
2. If no error is found, check if the comparison is just taking a long time to generate, some longer files can take a long time to finish
3. If neither of these is the case, the server's connection to the backend has likely timed out, reset connection and see if this fixes the issue.
4. If all these fail there is a critical issue in the codebase, server should be brought down for maintenance and the issue needs to be corrected

Malicious Submission to damage site

1. If a maintenance member suspects a submission to be malicious (extremely large file, file designed to crash the system etc) they have full authority and ability to directly remove it from the database.

Security Breach Detected

1. Immediately take down the site
2. Assess if any / what information has been accessed or stolen
3. Patch the means at which the security breach was possible
4. Test the method of the security breach on a local copy of the system to see if the patch was implemented correctly
5. Once security breach is fixed and has been properly tested, put the site back online

General Procedure:

1. Check railway for any immediate errors, most cases of error will be resolved here.
2. Browse database for any malicious submissions, if a submission is impacting the usability of the system, delete the submission from the database.
3. If neither of the above solves the issue reset the servers connection
4. If all of the above fail, critical error is present, take down the site for immediate maintenance
